

Vredo

The technique
of overseeding

Your fields, our passion

Optimal grassland management

The basis of a good diet starts with high-quality grass. Fortunately, Vredo overseeders allow you to get the most out of your grassland. We keep your seeds protected, rain or shine, and ensure optimal germination opportunities by placing them in the soil at the correct sowing depth. The result? Nutritious green grass that even your neighbours will be jealous of. That is grassland management at its best.

Your fields, our passion!

Latest innovations and technological developments

Every Vredo overseeder is guaranteed to be a robust and high-quality machine that meets the latest innovations and technological developments. Recognizable by an advanced and unparalleled double disc system and extremely accurate seed dosing, our all-rounders are a household name in the agricultural sector worldwide. An investment for life.

Maximum business return

All Vredo overseeders are developed and produced in-house and help you improve your grassland and business return. Did you know that overseeding is the most cost-effective way of grassland rejuvenation? The fact that our overseeders deliver impressive results has been confirmed by several national and international studies in recent years:

- Young grasses absorb many more nutrients and are therefore more effective in grassland production
- At least 15% more grass yield
- Higher net profit; at least € 300/hectare
- Up to 98% even distribution
- Up to 96% germination rate

A company with a history

Vredo. Your fields, our passion

Vredo designs, produces and sells machines to the agricultural sector worldwide. We have grown from a small machine builder into a leading international family business. Our origins date back to 1947, when Ben de Vree, as a farmer's son, started a contracting company in Dodewaard.

It is the dry summer of 1976. The grass is wilting and there is insufficient food for the animals. Looking for a solution to produce sufficient feed despite the drought, young Ben designs a machine that breathes new life into his grassland: the Vredo overseeder!

In the late 1980s, the operating principle of this overseeder was used to develop the first slurry injector. Later, slurry tankers were also added, followed in the 1990s by the Vredo Trac. Today, many farmers and contractors successfully use our overseeding technology, as well as our view on circular agriculture.
